UNDERSTANDING LINEAR AND ABSOLUTE VALUE FUNCTIONS

LINEAR FUNCTIONS ARE FOUNDATIONAL MATHEMATICAL EXPRESSIONS REPRESENTED BY EQUATIONS OF THE FORM $f(x) = mx + b$, WHERE m IS THE SLOPE AND b IS THE Y-INTERCEPT. THESE FUNCTIONS PRODUCE STRAIGHT-LINE GRAPHS WITH CONSTANT RATES OF CHANGE. ABSOLUTE VALUE FUNCTIONS, TYPICALLY EXPRESSED AS $f(x) = |x|$, DIFFER BY MEASURING THE DISTANCE OF A NUMBER FROM ZERO, RESULTING IN A CHARACTERISTIC V-SHAPED GRAPH. BOTH FUNCTION TYPES ARE ESSENTIAL IN ALGEBRA AND PRE-CALCULUS, SERVING AS BUILDING BLOCKS FOR MORE COMPLEX FUNCTION TRANSFORMATIONS. UNDERSTANDING THEIR BASIC GRAPHS AND EQUATIONS IS CRUCIAL BEFORE ANALYZING ANY TRANSFORMATIONS.

TYPES OF TRANSFORMATIONS

TRANSFORMATIONS ALTER THE POSITION, SIZE, OR ORIENTATION OF A FUNCTION'S GRAPH WITHOUT CHANGING ITS FUNDAMENTAL SHAPE. THE PRIMARY TYPES OF TRANSFORMATIONS INCLUDE TRANSLATIONS (SHIFTS), REFLECTIONS (FLIPS), STRETCHES, AND COMPRESSIONS. EACH TYPE AFFECTS THE FUNCTION'S EQUATION IN A SPECIFIC WAY, EITHER INSIDE THE FUNCTION'S ARGUMENT OR OUTSIDE IT. RECOGNIZING THESE CHANGES ALLOWS ACCURATE GRAPHING AND INTERPRETATION OF TRANSFORMED FUNCTIONS.

TRANSLATIONS

TRANSLATIONS SHIFT THE GRAPH HORIZONTALLY OR VERTICALLY WITHOUT CHANGING ITS SHAPE OR ORIENTATION. HORIZONTAL TRANSLATIONS INVOLVE ADDING OR SUBTRACTING A CONSTANT INSIDE THE FUNCTION'S ARGUMENT, SUCH AS $f(x - h)$, SHIFTING THE GRAPH RIGHT OR LEFT. VERTICAL TRANSLATIONS INVOLVE ADDING OR SUBTRACTING A CONSTANT OUTSIDE THE FUNCTION, LIKE $f(x) + k$, MOVING THE GRAPH UP OR DOWN.

REFLECTIONS

REFLECTIONS FLIP THE GRAPH ACROSS A SPECIFIC AXIS. MULTIPLYING THE FUNCTION BY -1 PRODUCES REFLECTIONS. REFLECTING ACROSS THE X-AXIS IS REPRESENTED BY $-f(x)$, WHILE REFLECTING ACROSS THE Y-AXIS INVOLVES REPLACING x WITH $-x$ INSIDE THE FUNCTION, AS IN $f(-x)$.

STRETCHES AND COMPRESSIONS

THESE TRANSFORMATIONS CHANGE THE SIZE OF THE GRAPH VERTICALLY OR HORIZONTALLY. VERTICAL STRETCHES OR COMPRESSIONS ARE DONE BY MULTIPLYING THE ENTIRE FUNCTION BY A FACTOR GREATER THAN OR LESS THAN ONE, RESPECTIVELY. HORIZONTAL STRETCHES OR COMPRESSIONS OCCUR BY MULTIPLYING THE INPUT VARIABLE BY A RECIPROCAL FACTOR INSIDE THE FUNCTION.

TRANSFORMATIONS OF LINEAR FUNCTIONS

LINEAR FUNCTIONS RESPOND PREDICTABLY TO TRANSFORMATIONS DUE TO THEIR SIMPLE FORM. UNDERSTANDING THE EFFECT OF EACH TRANSFORMATION ON THE SLOPE AND INTERCEPT HELPS IN GRAPHING AND SOLVING PROBLEMS EFFICIENTLY. THE GENERAL TRANSFORMED LINEAR FUNCTION CAN BE EXPRESSED AS $g(x) = a f(b(x - h)) + k$, WHERE PARAMETERS a , b , h , AND k CONTROL DIFFERENT TRANSFORMATIONS.

HORIZONTAL AND VERTICAL TRANSLATIONS

FOR A LINEAR FUNCTION $f(x) = mx + b$, A HORIZONTAL SHIFT BY h UNITS CHANGES THE FUNCTION TO $f(x - h) = m(x - h) + b$. THIS MOVES THE GRAPH LEFT IF h IS NEGATIVE AND RIGHT IF POSITIVE. A VERTICAL SHIFT BY k UNITS CHANGES THE FUNCTION TO $f(x) + k = mx + b + k$, SHIFTING THE GRAPH UP OR DOWN ACCORDINGLY.

REFLECTIONS

REFLECTING THE LINEAR FUNCTION ACROSS THE X-AXIS INVOLVES MULTIPLYING BY -1 , GIVING $-f(x) = -mx - b$. THIS INVERTS THE SLOPE AND INTERCEPT, FLIPPING THE LINE OVER THE X-AXIS. REFLECTING ACROSS THE Y-AXIS CHANGES THE FUNCTION TO $f(-x) = m(-x) + b = -mx + b$, REVERSING THE SLOPE BUT KEEPING THE INTERCEPT UNCHANGED.

VERTICAL AND HORIZONTAL STRETCHES/COMPRESSIONS

VERTICAL STRETCHING OR COMPRESSION INVOLVES MULTIPLYING THE FUNCTION BY A FACTOR a . FOR EXAMPLE, $g(x) = a f(x) = a(mx + b) = amx + ab$. IF $|a| > 1$, THE LINE STRETCHES VERTICALLY; IF $0 < |a| < 1$, IT COMPRESSES. HORIZONTAL STRETCHES AND COMPRESSIONS USE A FACTOR b INSIDE THE FUNCTION: $g(x) = f(bx) = m(bx) + b = mbx + b$. HERE, $|b| > 1$ COMPRESSES THE GRAPH HORIZONTALLY, WHILE $0 < |b| < 1$ STRETCHES IT.

TRANSFORMATIONS OF ABSOLUTE VALUE FUNCTIONS

ABSOLUTE VALUE FUNCTIONS, WRITTEN AS $f(x) = |x|$, EXHIBIT DISTINCT TRANSFORMATION BEHAVIORS DUE TO THEIR V-SHAPED GRAPH. TRANSFORMATIONS AFFECT THE VERTEX POSITION, THE ANGLE OF THE V, AND THE ORIENTATION. UNDERSTANDING THESE EFFECTS IS CRITICAL FOR ACCURATE GRAPH INTERPRETATION AND PROBLEM SOLVING.

TRANSLATIONS OF ABSOLUTE VALUE FUNCTIONS

HORIZONTAL TRANSLATIONS SHIFT THE VERTEX ALONG THE X-AXIS, REPRESENTED BY $f(x - h) = |x - h|$. VERTICAL TRANSLATIONS MOVE THE VERTEX UP OR DOWN, SHOWN AS $f(x) + k = |x| + k$. THESE TRANSLATIONS REPOSITION THE GRAPH WITHOUT CHANGING ITS SHAPE.

REFLECTIONS

REFLECTING AN ABSOLUTE VALUE FUNCTION ACROSS THE X-AXIS IS DONE BY MULTIPLYING THE FUNCTION BY -1 : $-|x|$. THIS FLIPS THE V SHAPE UPSIDE DOWN. REFLECTING ACROSS THE Y-AXIS INVOLVES REPLACING x WITH $-x$, BUT SINCE $|x| = |-x|$, THE GRAPH REMAINS UNCHANGED BY THIS REFLECTION.

VERTICAL AND HORIZONTAL STRETCHES AND COMPRESSIONS

VERTICAL STRETCHES AND COMPRESSIONS MULTIPLY THE ABSOLUTE VALUE BY A FACTOR A : $g(x) = A|x|$. VALUES $|A| > 1$ MAKE THE V NARROWER, WHILE $0 < |A| < 1$ MAKE IT WIDER. HORIZONTAL STRETCHES AND COMPRESSIONS INVOLVE REPLACING x WITH Bx : $g(x) = |Bx|$. HERE, $|B| > 1$ COMPRESSES THE GRAPH HORIZONTALLY, AND $0 < |B| < 1$ STRETCHES IT.

ANSWER KEY: COMMON TRANSFORMATION PROBLEMS

THIS SECTION PROVIDES PRECISE SOLUTIONS AND EXPLANATIONS FOR TYPICAL PROBLEMS INVOLVING 1.2 TRANSFORMATIONS OF LINEAR AND ABSOLUTE VALUE FUNCTIONS. EACH EXAMPLE DEMONSTRATES THE PROCESS OF IDENTIFYING AND APPLYING TRANSFORMATIONS CORRECTLY.

1. **PROBLEM:** GIVEN $f(x) = 2x + 3$, FIND THE EQUATION AFTER SHIFTING RIGHT 4 UNITS AND DOWN 2 UNITS.

ANSWER: $g(x) = 2(x - 4) + 3 - 2 = 2x - 8 + 1 = 2x - 5$.

2. **PROBLEM:** REFLECT $f(x) = |x|$ ACROSS THE X-AXIS AND SHIFT UP 5 UNITS.

ANSWER: $g(x) = -|x| + 5$.

3. **PROBLEM:** COMPRESS VERTICALLY THE FUNCTION $f(x) = 3x + 1$ BY A FACTOR OF $1/2$.

ANSWER: $g(x) = (1/2)(3x + 1) = (3/2)x + 1/2$.

4. **PROBLEM:** STRETCH HORIZONTALLY BY A FACTOR OF 3 THE FUNCTION $f(x) = |x|$.

ANSWER: $g(x) = |(1/3)x|$.
