Sample 13 3 Practice Problems with Solutions

Below are examples of typical 13 3 practice problems along with detailed solutions to demonstrate

effective problem-solving approaches.

Problem 1: Simplify an Algebraic Expression

Problem: Simplify the expression $3(2x + 4) - 5(x - 1)$.

Solution: First, expand the terms:

- $3(2x + 4) = 6x + 12$

- $-5(x - 1) = -5x + 5$

Combine like terms:

$$(6x - 5x) + (12 + 5) = x + 17$$

Final simplified expression: $x + 17$

Problem 2: Solve a Linear Equation

Problem: Solve for x : $4x - 7 = 2x + 5$.

Solution: Subtract $2x$ from both sides:

$$4x - 2x - 7 = 5$$

$$2x - 7 = 5$$

Add 7 to both sides:

$$2x = 12$$

Divide both sides by 2:

$$x = 6$$

Problem 3: Application Word Problem

Problem: A rectangle's length is 3 times its width. If the perimeter is 48 units, find the dimensions of the rectangle.

Solution: Let the width be w . Then length = $3w$.

Perimeter formula: $P = 2(\text{length} + \text{width})$

$$48 = 2(3w + w)$$

$$48 = 2(4w) = 8w$$

Divide both sides by 8:

$$w = 6 \text{ units}$$

$$\text{Length} = 3w = 18 \text{ units}$$

The rectangle's dimensions are 18 units by 6 units.
