DEFINITION AND BASIC CONCEPT OF DILATIONS

DILATIONS ARE A TYPE OF GEOMETRIC TRANSFORMATION THAT CHANGES THE SIZE OF A FIGURE WITHOUT ALTERING ITS SHAPE. THIS TRANSFORMATION IS CENTERED AROUND A FIXED POINT KNOWN AS THE CENTER OF DILATION, AND IT INVOLVES SCALING THE FIGURE BY A CERTAIN FACTOR CALLED THE SCALE FACTOR. WHEN THE SCALE FACTOR IS GREATER THAN 1, THE FIGURE ENLARGES; WHEN IT IS BETWEEN 0 AND 1, THE FIGURE REDUCES IN SIZE. THE FUNDAMENTAL NATURE OF DILATIONS LIES IN THEIR ABILITY TO PRESERVE THE ANGLES AND THE PROPORTIONAL LENGTHS OF CORRESPONDING SIDES IN GEOMETRIC FIGURES.

UNDERSTANDING THE CENTER OF DILATION

THE CENTER OF DILATION IS A FIXED POINT IN THE PLANE FROM WHICH ALL POINTS OF A FIGURE ARE EXPANDED OR CONTRACTED. ALGEBRAICALLY, THIS POINT IS CRUCIAL BECAUSE IT SERVES AS THE REFERENCE FOR THE TRANSFORMATION. ANY POINT ON THE FIGURE IS MOVED ALONG THE LINE THAT CONNECTS IT TO THE CENTER OF DILATION, WITH THE DISTANCE FROM THE CENTER MULTIPLIED BY THE SCALE FACTOR.

SCALE FACTOR AND ITS IMPACT

THE SCALE FACTOR DETERMINES THE DEGREE OF DILATION. A SCALE FACTOR OF 1 RESULTS IN THE ORIGINAL FIGURE, INDICATING NO CHANGE. VALUES GREATER THAN 1 PRODUCE AN ENLARGEMENT, WHILE VALUES BETWEEN 0 AND 1 CREATE A REDUCTION. NEGATIVE SCALE FACTORS CAN ALSO BE CONSIDERED, WHICH COMBINE DILATION WITH A REFLECTION ABOUT THE CENTER POINT.

ALGEBRAIC FORMULATION OF DILATIONS

THE ALGEBRAIC REPRESENTATION OF DILATIONS INVOLVES EXPRESSING THE TRANSFORMATION IN TERMS OF COORDINATES AND SCALE FACTORS. THIS ALLOWS FOR THE PRECISE CALCULATION OF THE IMAGE OF ANY POINT AFTER DILATION. TYPICALLY, THE

FORMULAS DEPEND ON WHETHER THE CENTER OF DILATION IS AT THE ORIGIN OR AT AN ARBITRARY POINT IN THE PLANE.

DILATION CENTERED AT THE ORIGIN

WHEN THE CENTER OF DILATION IS AT THE ORIGIN $(0,0)$, THE ALGEBRAIC FORMULA FOR THE DILATION OF A POINT (x, y) WITH SCALE FACTOR k IS STRAIGHTFORWARD:

- **IMAGE POINT COORDINATES:** $(x', y') = (kx, ky)$

THIS MEANS EACH COORDINATE OF THE ORIGINAL POINT IS MULTIPLIED BY THE SCALE FACTOR, RESULTING IN A PROPORTIONAL TRANSFORMATION THAT MAINTAINS THE POINT'S DIRECTION FROM THE ORIGIN.

DILATION CENTERED AT AN ARBITRARY POINT

FOR A CENTER OF DILATION AT A POINT (x_c, y_c) , THE ALGEBRAIC REPRESENTATION ADJUSTS TO ACCOUNT FOR THIS SHIFT. THE FORMULA FOR THE IMAGE POINT (x', y') OF (x, y) UNDER DILATION WITH SCALE FACTOR k IS:

- $x' = x_c + k(x - x_c)$
- $y' = y_c + k(y - y_c)$

THIS FORMULA TRANSLATES THE POINT RELATIVE TO THE CENTER, APPLIES THE SCALE FACTOR, AND THEN TRANSLATES IT BACK, EFFECTIVELY PERFORMING THE DILATION AROUND THE SPECIFIED CENTER.

PROPERTIES OF ALGEBRAIC REPRESENTATIONS OF DILATIONS

ALGEBRAIC REPRESENTATIONS OF DILATIONS EXHIBIT SEVERAL IMPORTANT PROPERTIES THAT CHARACTERIZE THE NATURE OF THIS TRANSFORMATION. UNDERSTANDING THESE PROPERTIES HELPS IN ANALYZING AND PREDICTING THE OUTCOMES OF DILATIONS ON VARIOUS GEOMETRIC FIGURES.

PRESERVATION OF ANGLE MEASURES

DILATIONS PRESERVE THE MEASURES OF ANGLES WITHIN GEOMETRIC FIGURES. THIS IMPLIES THAT THE SHAPE OF A FIGURE REMAINS UNCHANGED, EVEN THOUGH THE SIZE MAY VARY SIGNIFICANTLY. THE ALGEBRAIC FORMULAS ENSURE THAT THE PROPORTIONAL RELATIONSHIPS BETWEEN POINTS MAINTAIN CONSISTENT ANGULAR VALUES.

PROPORTIONALITY OF SIDE LENGTHS

ALL LENGTHS BETWEEN POINTS IN A DILATED FIGURE ARE SCALED BY THE SAME FACTOR k . THIS PROPORTIONALITY IS CENTRAL TO THE ALGEBRAIC REPRESENTATION, AS MULTIPLYING EACH COORDINATE DIFFERENCE BY k RESULTS IN UNIFORMLY SCALED DISTANCES.

COLLINEARITY AND PARALLELISM PRESERVATION

LINE AND POINTS THAT ARE COLLINEAR BEFORE DILATION REMAIN COLLINEAR AFTER TRANSFORMATION. SIMILARLY, PARALLEL LINES STAY PARALLEL. THESE PROPERTIES ARE A DIRECT CONSEQUENCE OF THE LINEAR NATURE OF THE DILATION TRANSFORMATION EXPRESSED ALGEBRAICALLY.

EFFECT OF NEGATIVE SCALE FACTORS

WHEN THE SCALE FACTOR k IS NEGATIVE, THE DILATION INCLUDES A REFLECTION THROUGH THE CENTER COMBINED WITH SCALING. THE ALGEBRAIC REPRESENTATION ACCOMMODATES THIS BY ALLOWING k TO TAKE NEGATIVE VALUES, ALTERING THE ORIENTATION OF THE FIGURE ACCORDINGLY.

EXAMPLES OF ALGEBRAIC DILATIONS IN COORDINATE GEOMETRY

APPLYING ALGEBRAIC REPRESENTATIONS OF DILATIONS IN COORDINATE GEOMETRY PROVIDES CONCRETE EXAMPLES OF HOW FIGURES TRANSFORM UNDER DILATION. THESE EXAMPLES ILLUSTRATE THE USE OF FORMULAS AND PROPERTIES DISCUSSED EARLIER.

EXAMPLE 1: DILATION FROM THE ORIGIN

CONSIDER A TRIANGLE WITH VERTICES AT $A(2, 3)$, $B(4, 1)$, AND $C(3, 5)$. APPLYING A DILATION CENTERED AT THE ORIGIN WITH A SCALE FACTOR OF 2, THE NEW COORDINATES ARE:

- $A' = (2 \cdot 2, 3 \cdot 2) = (4, 6)$
- $B' = (4 \cdot 2, 1 \cdot 2) = (8, 2)$
- $C' = (3 \cdot 2, 5 \cdot 2) = (6, 10)$

THE TRIANGLE IS ENLARGED, WITH ALL POINTS MOVING AWAY FROM THE ORIGIN BY TWICE THEIR ORIGINAL DISTANCE.

EXAMPLE 2: DILATION FROM AN ARBITRARY CENTER

FOR A DILATION CENTERED AT $C(1, 1)$ WITH A SCALE FACTOR OF 0.5, A POINT $P(5, 3)$ TRANSFORMS AS FOLLOWS:

- $x' = 1 + 0.5(5 - 1) = 1 + 0.5(4) = 3$
- $y' = 1 + 0.5(3 - 1) = 1 + 0.5(2) = 2$

THUS, THE IMAGE POINT P' IS LOCATED AT $(3, 2)$, DEMONSTRATING A REDUCTION IN SIZE RELATIVE TO THE CENTER.

APPLICATIONS OF ALGEBRAIC REPRESENTATIONS OF DILATIONS

ALGEBRAIC REPRESENTATIONS OF DILATIONS HAVE BROAD APPLICATIONS ACROSS MULTIPLE DISCIPLINES. THEIR ABILITY TO ACCURATELY DESCRIBE SIZE TRANSFORMATIONS MAKES THEM ESSENTIAL IN THEORETICAL AND PRACTICAL CONTEXTS.

COMPUTER GRAPHICS AND IMAGE SCALING

IN COMPUTER GRAPHICS, ALGEBRAIC DILATIONS ALLOW FOR THE RESIZING OF IMAGES AND OBJECTS WITHOUT DISTORTION. SCALE FACTORS APPLIED TO PIXEL COORDINATES MODIFY THE SIZE WHILE RETAINING THE ORIGINAL PROPORTIONS, CRUCIAL FOR RENDERING AND ANIMATION.

FREQUENTLY ASKED QUESTIONS

WHAT IS AN ALGEBRAIC REPRESENTATION OF A DILATION IN COORDINATE GEOMETRY?

AN ALGEBRAIC REPRESENTATION OF A DILATION IN COORDINATE GEOMETRY IS A TRANSFORMATION THAT MULTIPLIES THE COORDINATES OF A POINT BY A SCALE FACTOR RELATIVE TO A FIXED CENTER POINT, OFTEN EXPRESSED AS $(x, y) \rightarrow (kx, ky)$ WHEN THE CENTER IS AT THE ORIGIN.

HOW DO YOU REPRESENT A DILATION ALGEBRAICALLY WHEN THE CENTER IS NOT AT THE ORIGIN?

WHEN THE CENTER OF DILATION IS AT A POINT (h, k) , THE ALGEBRAIC REPRESENTATION FOR A POINT (x, y) WITH SCALE FACTOR r IS GIVEN BY: $(x, y) \rightarrow (h + r(x - h), k + r(y - k))$.

WHAT ROLE DOES THE SCALE FACTOR PLAY IN THE ALGEBRAIC REPRESENTATION OF DILATION?

THE SCALE FACTOR DETERMINES HOW MUCH THE FIGURE IS ENLARGED OR REDUCED. IN THE ALGEBRAIC REPRESENTATION, IT MULTIPLIES THE DISTANCES FROM THE CENTER OF DILATION TO EACH POINT, AFFECTING THE COORDINATES ACCORDINGLY.

CAN DILATION BE REPRESENTED USING MATRIX MULTIPLICATION ALGEBRAICALLY?

YES, DILATION CAN BE REPRESENTED USING MATRIX MULTIPLICATION. FOR A DILATION CENTERED AT THE ORIGIN WITH SCALE FACTOR r , THE TRANSFORMATION MATRIX IS $\begin{bmatrix} r & 0 \\ 0 & r \end{bmatrix}$, WHICH WHEN MULTIPLIED BY THE COORDINATE VECTOR (x, y) , SCALES THE POINT.

HOW DO YOU WRITE THE ALGEBRAIC EQUATION FOR A DILATION OF A LINE SEGMENT?

IF A LINE SEGMENT HAS ENDPOINTS (x_1, y_1) AND (x_2, y_2) , AFTER DILATION WITH CENTER (h, k) AND SCALE FACTOR r , THE NEW ENDPOINTS ARE $(h + r(x_1 - h), k + r(y_1 - k))$ AND $(h + r(x_2 - h), k + r(y_2 - k))$.

WHAT IS THE EFFECT OF A DILATION WITH SCALE FACTOR LESS THAN 1 ALGEBRAICALLY?

ALGEBRAICALLY, A SCALE FACTOR LESS THAN 1 REDUCES THE COORDINATES OF POINTS RELATIVE TO THE CENTER OF DILATION, RESULTING IN A SMALLER, SIMILAR FIGURE.

HOW DO NEGATIVE SCALE FACTORS AFFECT ALGEBRAIC REPRESENTATIONS OF DILATION?

A NEGATIVE SCALE FACTOR IN DILATION ALGEBRAICALLY REFLECTS THE FIGURE ACROSS THE CENTER OF DILATION AND SCALES IT BY THE ABSOLUTE VALUE OF THE SCALE FACTOR, PRODUCING AN INVERTED AND RESIZED FIGURE.

IS IT POSSIBLE TO COMBINE DILATION WITH OTHER TRANSFORMATIONS ALGEBRAICALLY?

YES, ALGEBRAICALLY, DILATION CAN BE COMBINED WITH OTHER TRANSFORMATIONS SUCH AS TRANSLATION, ROTATION, AND REFLECTION BY MULTIPLYING THEIR RESPECTIVE MATRICES OR APPLYING THEIR EQUATIONS SEQUENTIALLY.
