Frequently Asked Questions

What is the primary cause of acid rain in the environment?

The primary cause of acid rain is the emission of sulfur dioxide (SO₂) and nitrogen oxides (NO_x) from burning fossil fuels, which react with water vapor in the atmosphere to form sulfuric and nitric acids.

Which layer of the atmosphere contains the ozone layer that protects Earth from ultraviolet radiation?

The stratosphere contains the ozone layer that absorbs and protects Earth from harmful ultraviolet (UV) radiation.

What is the main difference between point source and nonpoint source pollution?

Point source pollution originates from a single, identifiable source such as a factory discharge pipe, while nonpoint source pollution comes from multiple diffuse sources like agricultural runoff.

Which greenhouse gas has the highest global warming potential over a 100-year period?

Nitrous oxide (N₂O) has a higher global warming potential than carbon dioxide (CO₂) over 100 years, but methane (CH₄) also has a significant impact; however, sulfur hexafluoride (SF₆) has an even higher potential but is less abundant.

What is the concept of ecological footprint in environmental science?

Ecological footprint measures the amount of biologically productive land and water area required to support a population's resource consumption and waste absorption.

Which practice is most effective in reducing soil erosion on agricultural lands?

Contour plowing and terracing are effective practices that reduce soil erosion by following the natural contours of the land to slow water runoff.

What role do keystone species play in an ecosystem?

Keystone species have a disproportionately large impact on their ecosystem relative to their abundance, helping maintain the structure and balance of the ecological community.

Why is biodiversity important for ecosystem resilience?

Biodiversity increases ecosystem resilience by providing a variety of species that can adapt to changes and maintain ecosystem functions under environmental stress.

Which human activity contributes most to the increase of atmospheric carbon dioxide?

Burning fossil fuels such as coal, oil, and natural gas for energy and transportation is the largest contributor to increasing atmospheric CO₂ levels.

What is the primary method for treating wastewater before it is released back into the environment?

The primary method involves physical, chemical, and biological treatment processes that remove contaminants, pathogens, and organic matter to make water safe for release.
