Sample Questions and Solutions from AP Statistics Test 2B

Reviewing sample questions along with detailed solutions from the ap statistics test 2b answer key provides practical insights into the exam format and question types. Below are examples illustrating typical problems encountered on the test.

Sample Question 1: Probability Calculation

Question: If a fair six-sided die is rolled twice, what is the probability that the sum of the two rolls is 7?

Solution: The answer key shows that the possible pairs summing to 7 are (1,6), (2,5), (3,4), (4,3), (5,2), and (6,1), totaling 6 favorable outcomes. Since there are $6 \times 6 = 36$ possible outcomes, the probability is $6/36 = 1/6$.

Sample Question 2: Constructing a Confidence Interval

Question: Given a sample mean of 50, a standard deviation of 8, and a sample size of 64, construct a 95% confidence interval for the population mean.

Solution: The answer key explains using the formula:

- Margin of error = $z^* \times (\sigma/\sqrt{n})$, where $z^* \approx 1.96$ for 95% confidence
- Margin of error = $1.96 \times (8/\sqrt{64}) = 1.96$
- Confidence interval = 50 ± 1.96 , or (48.04, 51.96)

Sample Question 3: Interpreting Regression Output

Question: Interpret the slope in a regression equation predicting weight from height, where the slope is 3.2.

Solution: The answer key clarifies that for each additional unit increase in height, weight is predicted to increase by 3.2 units on average, assuming a linear relationship.
