## Sample Questions and Their Answers

### 1. What is the primary cause of global warming?

The primary cause of global warming is the increased concentration of greenhouse gases in the atmosphere, mainly carbon dioxide (CO<sub>2</sub>) from burning fossil fuels such

as coal, oil, and natural gas.

**2. How does deforestation contribute to climate change?**

Deforestation contributes to climate change by reducing the number of trees that absorb CO<sub>2</sub>, thereby increasing the amount of greenhouse gases in the atmosphere and accelerating global warming.

**3. What are some renewable energy sources mentioned in the documentary?**

The documentary highlights renewable energy sources including solar power, wind energy, and hydropower as sustainable alternatives that help reduce carbon emissions.

**4. What role do international agreements play in combating climate change?**

International agreements, such as the Paris Agreement, establish global targets for reducing emissions and encourage countries to collaborate on climate mitigation and adaptation strategies.

**5. Why is it important to take immediate action on climate change?**

Immediate action is crucial to prevent irreversible environmental damage, protect vulnerable ecosystems, and ensure a sustainable future for coming generations.

## **Scientific Explanations Behind the Answers**

The before the flood worksheet answers are grounded in scientific research that explains the mechanisms of climate change and environmental degradation. Understanding these scientific principles enhances the credibility of the responses and equips learners with knowledge to critically assess environmental information. Topics such as the greenhouse effect, carbon cycles, and feedback loops in the climate system are explained to provide a solid foundation for the worksheet answers.

## **Understanding the Greenhouse Effect**

The greenhouse effect is a natural process where certain gases in the atmosphere trap heat, keeping the planet warm enough to sustain life. Human activities have intensified this effect by releasing excessive amounts of greenhouse gases, primarily CO<sub>2</sub> and methane, leading to an abnormal increase in global temperatures.

# **The Impact of Carbon Emissions**

Carbon emissions from industrial activities, transportation, and deforestation increase atmospheric CO<sub>2</sub> levels. This disrupts the natural balance of the carbon cycle, causing more heat to be trapped and contributing to climate change. The scientific explanations in the worksheet answers often detail this process to clarify why reducing emissions is essential.
