Sample Question 1: Define Key Terms

Question: Define the term *photosynthesis* and explain its significance in the ecosystem.

Answer: Photosynthesis is the biological process by which green plants, algae, and certain bacteria convert light energy into chemical energy, producing glucose and oxygen from carbon dioxide and water. The Krebs cycle processes pyruvate to generate electron carriers and carbon dioxide. Finally, the electron transport chain uses electrons from carriers to produce a large amount of ATP, completing the energy extraction from glucose.

Sample Question 3: Analyze Concepts

Question: How does chapter 3 explain the relationship between structure and function in cell membranes?

Answer: Chapter 3 explains that the cell membrane's structure—a phospholipid bilayer with embedded proteins—allows selective permeability, enabling the cell to regulate substances entering and exiting. This structural arrangement supports functions such as communication, transport, and protection, essential for maintaining cellular homeostasis.
