Frequently Asked Questions

What is Newton's First Law of Motion?

Newton's First Law states that an object will remain at rest or in uniform motion in a straight line unless acted upon by an external force.

What is the formula for calculating speed?

Speed is calculated by dividing the distance traveled by the time taken, expressed as $\text{speed} = \text{distance} / \text{time}$.

What is the difference between mass and weight?

Mass is the amount of matter in an object and is measured in kilograms, while weight is the force exerted by gravity on that mass and is measured in newtons.

What does the term 'acceleration' mean in physics?

Acceleration is the rate at which an object's velocity changes over time.

What is potential energy?

Potential energy is the energy stored in an object due to its position or configuration, such as a book on a shelf having gravitational potential energy.

What is the unit of force in the International System of Units (SI)?

The unit of force in SI is the newton (N).

How does gravity affect objects on Earth?

Gravity pulls objects toward the center of the Earth, giving them weight and causing them to fall when dropped.
